Data Cleaning Items:

- Standardize Text:
  - Lowercase
  - Map names to each other
  - Maybe: strip whitespaces for certain entries if needed, but might not be necessary
  - Change text yes/no to booleans
  - Ensure time is date time(unless we want to change it from days from xyz)
- Remove Redundancies
  - Remove duplicates
  - Remove redundant features: only need one of ccf_mean, ccf_std and math_score and one of n_mutations or tmb_score
- Handling Missing Variables:
  - We can decide the threshold for if a column is a missing a certain number of inputs to drop
  - Of the rows we are using(those that have the matching primary and metastasis), we can decide to impute certain missing values; either single or regression imputation but we probably want regression here if we decide to impute
  - Change the NaN variable for n_mutations in MSK-IMPACT to 0 instead
  - in treatment data,missing record is not the same as “untreated.” patients with no record are lumped in with true treatment-naive patients, but we should treat missing as separate category
